PRODUCE ACCURATE COLORS

EasyMEDIA is Caldera's integrated calibration and profile making solution, which will give you high quality and "on the mark" output.

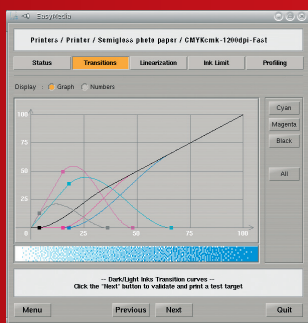

This option allows you to create ICC profiles for monitors, printers and scanners for guaranteeing colour quality consistency on the whole graphical chain.

Caldera offers very accurate colour management by determining parameters according to the image (vector, grayscale, RGB or CMYK). Profiles included in files (like PDF) are automatically detected and extracted to be applied. Caldera also provides spot colours support through the CXF library and automatic detection of named /spot colours with full simulation of output colour based on output profiles.

The new version of Easymedia with i1Prism will bring end-users an incredible color experience.

i1Prism, the new X-Rite Profile building engine, contains a new ICC Profile generator that enhances Color separation and Color matching in the Caldera print workflow.

Users will benefit from the latest state-of-the-art algorithms to print colors that were not reachable with previous profilers with a higher accuracy than before. Smoother and larger gamuts will provide an extended and better color matching.
